Abstract

Academic project management in educational institutions often faces challenges such as manual progress tracking, delayed identification of project risks, fragmented communication, and limited visibility into project status. Existing systems primarily focus on project administration and lack intelligent mechanisms for early risk detection. This paper proposes **AI-AcadPredict**, an AI-integrated academic project management and delay risk prediction platform. The system utilizes React.js, Spring Boot, MySQL, Python, FastAPI, JWT authentication, Docker, and a Random Forest machine learning model to analyze project data and predict delay risk as Low, Medium, or High. Based on the prediction, adaptive actions such as reminders, alerts, and additional monitoring are triggered. The proposed solution aims to improve project tracking, enable timely intervention, enhance collaboration among students, faculty, and coordinators, and increase the likelihood of successful project completion.
